Git Branches: Takeaways ₪

by Dataquest Labs, Inc. - All rights reserved © 2021

Syntax

• Create a branch

```
git branch [branch name]
```

Switch to branch

```
git checkout [branch name]
```

Create and switch to branch

```
git checkout -b [branch name]
```

Show all of the remote branches

```
git branch -r
```

• Show all of the branches availably locally

```
git branch -a
```

• Merge a branch

```
git merge
```

• Delete a branch

```
git branch -d [branch name]
```

Update Git's list of branch names and commits

```
git fetch
```

Concepts

- Branches allow us to create several different work areas within the same repo.
- Switching branches is useful when we want to work on changes to a project that require different amounts of development time.
- Git will prevent you from switching to a different branch if there is a potential merge conflict with the branch we're switching to.
- Git uses HEAD to refer to the current branch, as well the branch with the latest commit in that branch.
- Django is a popular Web framework for Python that programmers develop using Git and GitHub.
- In order to merge branch B into branch A, switch to branch A then merge the branch.
- Pull requests will show us the differences between branches in an attractive interface, and allow other developers to add comments.
- Typical branch names:

• Feature : feature/happy-bot

• Fix: fix/remove-error

• Chore: chore/add-analytics

Resources

- Pull Requests
- <u>Django</u>
